

World Mall — Final polish + verification + guest/web parity (ship-ready)

Context for agent

- App name **World Mall**
 - Stack: React/TS (Vite), Express/WS, PostgreSQL (Drizzle).
 - Production runs on Replit Autoscale (single port 80).
 - DB is already live; do **not** reset data.
 - World ID “Cloud Verify” v2 endpoint and `/api/verify/worldid` exist; we must ensure the **Mini App “Verify” command** → **proof** → **server verify** → **role=verified** works end-to-end.
 - Guest mode should work **both on web and inside the World App** with server-enforced limits.
-

0) Copy & content polish (landing hero)

Change landing copy:

- Replace the subheadline under **World Mall** with:
“**Talk. Learn. Build. Connect.**”
- Remove “One human, one voice.” everywhere.
- Keep the big **Enter Global Square** button.
- The secondary CTA on the landing should be “**Verify with World ID**” (not “Admin Access”). We’ll keep the admin page reachable only via a hidden `/admin` route (no visible button).

Files to touch (search & replace carefully):

- `client/src/pages/landing.tsx`
- any `client/src/locales/*` and hardcoded strings

Acceptance: Landing shows the new subheadline above the buttons; no “one voice” text remains.

1) Theme system: default light, toggle in header, system follow, optional “sunrise→sunset”

Goal: Fix the preview defaulting to dark and ship a reliable toggle.

Implementation plan

- Create a small **ThemeProvider** with these rules:
 - If `localStorage.theme` is set (`'light' | 'dark' | 'system' | 'autoSun'`), use it.
 - Else default to **'light'**.
 - `'system'` mirrors `prefers-color-scheme`.
 - `'autoSun'` = light between local sunrise/sunset, dark otherwise (approx: 7:00–19:00 local time; no geolocation needed).
- Provider applies a `data-theme="light|dark"` attribute on `<html>` and exposes `useTheme()` hook.
- Add a **ThemeToggle** control in the top-right app chrome (same place the language globe sits). Menu items:
 - **Light (default)**
 - **Dark**
 - **Match System**
 - **Auto (Sunrise → Sunset)**
- Persist selection in `localStorage.theme`.
- Remove any code that pre-applies `.dark` class at build time.

Files:

- `client/src/providers/ThemeProvider.tsx` (new)
- `client/src/hooks/use-theme.ts` (new lightweight hook)
- `client/src/index.css` (ensure CSS vars read from `[data-theme]`)
- `client/src/components/ThemeToggle.tsx` (new)
- Wire **ThemeProvider** at the root (`client/src/App.tsx`), and render **ThemeToggle** in the landing and in-room headers.

Acceptance:

- Fresh load on both web + World App = **light theme**.
- Toggling works immediately and persists on refresh.
- “Match System” responds to OS appearance changes.
- “Auto (Sunrise → Sunset)” flips appropriately using the simple 7–19h heuristic.

2) Fix the Verify with World ID flow (Mini App → server → role=verified)

What to change

- The “**Verify with World ID**” button must **open the World Mini App “verify” command** and on success POST the proof to `/api/verify/worldid`.

- Do **not** route to any “Admin Access” page. Remove/rename that button on landing.

Client details

- In `client/src/hooks/use-world-id.ts` (or wherever the verify UI lives), ensure:
 - It invokes the Mini App **Verify** command (incognito action) using the configured `WORLD_ID_ACTION`.
 - On success, POST the proof payload to `/api/verify/worldid`.
 - On 200 OK, promote local role → `verified` without a full page reload and refetch `/api/policy` + `/api/me`.
- In `client/src/pages/landing.tsx`, wire the button to that hook.

Server details

- In `server/routes.ts`:
 - Confirm that `/api/verify/worldid` uses the **Cloud Verify v2** endpoint with `WORLD_ID_APP_ID`, secret/key, and `WORLD_ID_ACTION`.
 - On success, store **SHA-256 of the nullifier** (unique constraint enforced) and set `role=verified` for that user, create/update `wm_uid` cookie.
- Harden with clear error messages for expired/invalid proofs.

Acceptance:

- From World App → tap **Verify** → iOS sheet opens, completes, server returns success, role becomes **verified** in UI.
 - Subsequent long posts (200+ chars), star/report, Work Mode all enabled.
-

3) Guest mode parity (web + World App) and gentler gating

Current issues to fix

- Web shows a modal “open in World App” that blocks; **remove hard block**. Show **soft banner** only.
- Some guest posts show “World ID verification required” even when within limits.

Policy (server-returned via `/api/policy`):

- `guestCharLimit = 60`
- `guestDaily = 10`
- `guestCooldownSec = 30`
- Verified: 240 chars; rate limits unchanged (5/min, 60/hr, 200/day).

Server changes

- In message create route, **do not require verification** for guest posts that meet the above limits. Only enforce verification for:
 - messages > 60 chars,
 - starring / reporting,
 - Work Mode posts.
- Log structured events: `guest_post.accepted` & `guest_post.blocked` with reason.
- Ensure **CORS + cookies** are not the reason posts fail inside the World App:
 - Set cookies `wm_sid/wm_uid` with `SameSite=None; Secure`.
 - Also accept a header fallback `X-Session` (client stores a UUID in localStorage) to avoid third-party cookie problems in WebViews.

Client changes

- **Remove** the blocking modal on web; keep a **soft banner** suggesting “Open in World App to unlock full features.”
- Composer shows a live **60/60 counter, messages left today**, and a small cooldown timer after posting.

Acceptance:

- As guest on **web**: can send ≤60 chars, up to 10/day, 30s cooldown between posts.
- As guest inside **World App**: same behavior; no red “verification required” for allowed posts.

4) Make messages show inside the World App (data & transport fixes)

Likely cause to cover proactively

- Cookies blocked in WebView / different domain → sessions not shared → posts rejected.
- Another common pitfall: dev DB vs prod DB mismatch, or day boundary filter.

Do this:

- Confirm **DB connection string** used by World App and by web preview is the same (we're in prod; do not change DB). Add a startup **smoke log** with DB URL host (masked).
- On the client, add a **transport fallback**: WS → SSE → polling (already mostly there). Make sure World App path uses SSE/poll if WS fails (some webviews block WS).
- Relax the **landing preview** query to show the **latest 10 across the last 7 days** (not “today only”) so judges always see activity.

- Add `/api/me` ping on load and log the resolved role + session id, so we can debug quickly.

Acceptance:

- Inside World App, the global feed populates and updates.
 - Landing “Live from Global Square” shows the latest 10 even if posted “yesterday”.
-

5) Landing buttons & routing cleanup

- Replace the current secondary landing button with “**Verify with World ID**” (wired to the verify flow).
- Hide/remove the visible **Admin Access** button from landing. Keep `/admin` route accessible manually (not linked).
- Ensure **Enter Global Square** always routes to the global room page.

Acceptance:

- No “Admin Access” button on landing.
 - “Verify with World ID” triggers in-app verification, not navigation to an admin page.
-

6) Small developer/QA affordances (non-judge visible)

- Overflow menu: “**Reset guest session**” (dev only, hidden behind `NODE_ENV !== 'production'` check OR only rendered if `?dev=1` present). It clears `localStorage` `guest_sid` and deletes `wm_sid` cookie to help the owner test limits.
- `/api/policy` and `/api/me` are called on app boot and results are logged (only in dev & console).

Acceptance: Owner can clear guest session locally and immediately re-test limits.

7) Observability & guards

- Minimal counters:
 - `verify.success`, `verify.failure`
 - `guest_post.accepted`, `guest_post.blocked`.`{reason}`
- Structured logs include `{ room, role, length, reason }` for blocks.

- Fail the server at boot if `WORLD_ID_APP_ID` or `WORLD_ID_ACTION` is missing in production.
-

8) Update docs & config

- Verify `.env.example` includes:
 - `WORLD_ID_APP_ID=...`
 - `WORLD_ID_ACTION=world-mall/verify`
 - `WORLD_ID_CLOUD_SECRET=...` (or whatever the Cloud verify key is named)
 - `ENABLE_PERMIT2=false` (keep off)
 - Update `README.md` “How verification works” section with the final flow + testing notes (web vs World App).
 - Ensure `.replit` stays single-port autoscale; **no dev/HMR in prod.**
-

9) Acceptance test script (please run in this order)

1. **Landing polish:** See “Talk. Learn. Build. Connect.” subheadline. No “one voice” anywhere.
 2. **Theme:** Confirm default is **light** on fresh load; use header toggle to switch to dark, system, auto; refresh persists.
 3. **Guest (web):** Post “Hello World Mall!” (≤60 chars). Success → cooldown 30s starts. Try 11th post of the day → blocked with friendly message.
 4. **Guest (World App):** Same guest flow succeeds and is rate-limited; no “verify required” banner for allowed posts.
 5. **Verify:** Tap **Verify with World ID** in World App → complete flow → role becomes **verified** in UI without full reload.
 6. **Verified posting:** Post 200-char message; star/report buttons appear; Work Mode tab accessible.
 7. **Landing preview:** Top 10 messages appear even if they’re from prior day; Global feed updates in place.
-

10) Notes on why this fixes the problems Lucas reported

- **Dark shows by default** → We now force default `light` unless a stored preference says otherwise.
- **Verify button opened Admin** → Rewired to Mini App **Verify** command + `/api/verify/worldid`.

- **Web guests blocked by “open in World App”** → That modal is now a soft banner; web guests can post with server limits.
 - **Messages not appearing in World App** → Cookie `SameSite=None; Secure + X-Session` header fallback + SSE/poll fallback ensure the WebView can maintain a session and receive live updates.
 - **Landing preview empty** → Preview now pulls last 7 days, so judges always see chatter.
-

Please implement everything above, keep changes small and targeted, and do not drop production data. When done, reply with:

- A summary of files changed,
 - The final `/api/policy` payload,
 - Screenshots (or DOM snapshot) proving: light default, theme toggle present, soft banner (not blocking), and the verify flow.
-

Tiny extras

- Add a subtle **“Friends (coming soon)”** button in profile that opens a modal with a short blurb: “World Chat DM integration planned—add friends and DM via World App.” (no backend needed yet).
- Add an **Emoji / Reaction** stub (★, ❤️, 😊) as non-persisted UI to hint at future “Mall Coins” reactions.
